INSTALLATION INSTRUCTIONS – #31191

1   Raise and fully support the vehicle (a vehicle lift is recommended). If you do not have access to a lift, you may raise the rear using a jack to gain access to the necessary bolts.

2   Remove the two bolts behind each muffler as well as the gaskets and set aside to be reused later. See Figure 1 below.

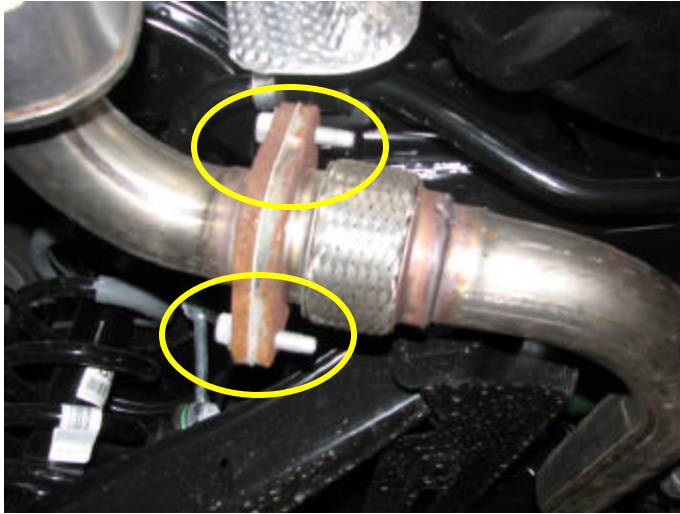

Figure 1: Factory bolts to be removed

3   Next, carefully remove each muffler off of the rubber isolators and discard. See Figure 2 below.

4   Next, slide a Torca clamp over the larger side of one of the straight sections of pipe, then slide in one of the under axle pipes. Loosely tighten. Repeat with other side.

5   Next, Slide a Torca clamp over one of the exhaust tips and insert onto the straight section. Be sure to place the left tip on the left side and vice versa. Repeat for other side. Loosely tighten.

6   Slide the driver's side axle-back section onto the rubber isolator and insert the bolts you removed earlier back into the flange. Be sure not to forget the gasket. See Figure 3 below. Tighten the bolts to 25 ft-lbs.

8   Now you should make adjustments to align the tip correctly, and tighten the two (2) Torca Clamps.

9   Repeat Steps 7 and 8 for the passenger side. The finished system should look like Figure 4.
